Description

Dietary therapy is to eat food in a manner adjusted to reduce weight or increase or increase diseases such as diabetes and obesity and treatment. Because weight loss depends on calorie intake, various types of caloric reduction diets were not effective for each other, such as emphasis on specific macronutrients (such as Lowfat, LowcarbDrate, etc.). When weight is recovered, nutritional success is predicted by long-term attachments. Regardless of this, the result of the meal varies greatly depending on the person.

The first popular diet was a "bunch" named after William. In his 1863 brochure, obesity letters dealt with the public have sketched the details of a particular low carb rate, low-calorie diet, which resulted in his own sharp weight loss.

Some guidelines recommend a diet to reduce the weight to remove people in labor health problems, but not for other healthy people. We are investigating that about half of all American adults are about 66.7% of obese adults, 26.5% of adults with ordinary weight or weight. It is too fat, normal weight, or dieter, which is weight, may increase mortality due to dietary therapy.

Each diet is the sum of food and drink that is usually consumed. A diet is an attempt to achieve or maintain a certain weight through a diet. People's dietary choices are often influenced by a variety of factors, including ethical and religious beliefs, clinical needs, or the desire to control weight.

Not all diets are considered healthy. Some people are eating an unhealthy diet because of their habits, rather than a conscious decision to eat an unhealthy diet. Terms applicable to such diets include "junk food diet" and "western diet". Many diets are seen by clinicians as having significant health risks and minimal long-term benefits. This is especially true for "crash" or "fashionable" diets. This is a short-term weight loss plan with significant changes to a person's normal diet.

Buddhism Nutrition

The Buddhists are practicing vegetarian based on the first strict interpretation of five of the five bids, while there is no special diet.

Hindus and Jain Diets

Hinduism and Jainism trailers can follow a Vegetarian diet based on Ahimsa's principle.

Islamic Nutrition Law

Muslims Follow the monopoly therapy of Islam-tolerated food monopolized. The opposite of Halal is Haram, Islamic food is impossible. Haram substances include alcohol, pork, and meat from animals that were not killed by the merchant method of animal clause.

Principles that Affect Nutrition

Number of principles that affect nutrition of many members of raster fali exercise. The principle means that natural food should be consumed. Some raster fararians interpret it and judge Vegetarian and Beachanism.

Kosher Nutrition

The food permitted under KASCHRUT should be a Jewish nutrition law. Some food and food combinations are non-HER, and food failures with Kasfrut cannot be cooked in other cases. Cevende Advantage focuses on banned drinks and complete food for alcohol and cafe indo links, and prohibits Judaian church cocercus. About half of adventurians are breast blood pressure.

Wisdom Words

Bible books accepted by members of Jesus Christian Church, a part of the education and alliance, a member of the Latellaxian saints. Nutritional advice includes healthy plants. In contrast to cigarettes, alcohol, coffee and tea, brown compliance to MeataVidance was optional under Lasten's Lore's Jesus Christian church, and emphasized the expiration of meat. Official church publishing country modern cooling method can be able to get the meat for every season.

REMBA / LEMBA Diet

Lebba people and Lessa people can find them in South Africa; their meals are based on their culture. While your day contains

meat and carbohydrates, the meat is sacrificed in a specific way to release the maximal blood of the animal. They pay particular attention to cookware used for people's cleanliness, cooking and food. Their diet excludes pork.

Low carb diets limit carbohydrate consumption compared to the average diet. Carbohydrate content (eg, sugar, bread, pasta) is limited and replaced with food containing higher percentage fat and protein (eg meat, poultry, fish, shell, egg, cheese, nuts and seeds). It is. Low carb food (spinach, cabbage, seeds, carrots and other fiber vegetables).

Lack of standardization, how much the amount of carbohydrate low carb diet has to have, this is a complex research. The Definition of the American Family Medical Academy adds lowcarb diets to content less than 20 mm. Low carb water-added feed is determined by the weight loss mainly by calorie restriction and adhesion, so low-carbohydrate diet diet is a specific health of weight loss to achieve the result to a low carb diet. There is no good evidence that benefits. The macro nutrient graphic ratio of the lowcarb diet is not standardized. From 2018, contradictory definitions of "lowcarb" Di-diet are doing complex research on topics.

National lipid association and lifestyle task forces define low carb diet dining and contains calories of less than 25% carbohydrate, and very low carbohydrate diet, 10 mm carb contains the risk. The 2016 carbohydrate of 50 g carbohydrates per day (less than 10% of total calories) is "very low" and a 40% diet of carbohydrate calories "mild" for feed as "mild" low carb diet. Less than 10%). The UK National Health Service recommends that "carbohydrates should be the main source of the body in a healthy and balanced diet."

Ketogenic food is primarily high-fat, suitable protein, low carb diet for medical treatment for hard-to-child

treatment in children. Dietary therapy forces fatty fat as carbohydrate. Carbohydrates are usually converted to food in glucose, which is transported around the body and is important to burn brain function. However, if the liver remains in fat, the liver converts fat into fatty acids and ketone bodies, the latter reaches the brain and replaces glucose as an energy source. A ketone body of a high level in blood (state called ketosis) is ultimately reducing the frequency of epileptic attack. We saw about half of the epileptic number of epilepsy trapped by half of the epilepsy of this diet. Adults may benefit from diet and diet, and it indicates that the exact system such as the fixes of the modified Atkins is effectively similar. Side effects may include occlusion, high cholesterol, growth, deceleration, suction and kidney stone. The original therapeutic diet for pediatric epilepsy provides enough protein for body growth and repair, and enough calories to maintain a weight suitable for age and height.

The classic ketogenic diet was developed in the 1920s to treat childhood epilepsy and was widely used in the next decade, but its popularity diminished with the advent of powerful anticonvulsants. This classic ketogenic diet includes a 4: 1 ketogenic ratio, or a weight ratio of fat to a combination of protein and carbohydrate. This is achieved by cutting out high-carbohydrate foods such as starchy fruits and vegetables, bread, pasta, grains and sugar, and increasing consumption of high-fat foods such as nuts, creams and butter. Most dietary fats are composed of molecules called Long-Chain Triglycerides (LCTs). However, Medium-Chain Triglycerides (MCTs) (made from fatty acids with shorter carbon chains than LCTs) are more ketone body-producing. A classic diet variant known as the Ketogenic Diet MCT uses the form of coconut oil, which is rich in MCTs and provides about half the calories. This diet variant requires less total fat, which allows you to increase the proportion of carbohydrates and protein, allowing for a wider variety of foods.
